

# DALI Bus Wiring Basics

Category: DALI & Controls

This note describes typical wiring practices for DALI lighting control buses.

- TOPOLOGY: DALI allows mixed bus topologies (line, star, tree). Avoid large closed loops to limit fault finding complexity.
- LENGTH & LOADING: Observe maximum bus length and number of devices per DALI line as specified by the control gear manufacturer.
- CABLE TYPE: Use cables suitable for the environment and voltage. Maintain segregation from mains circuits unless the cable is specifically designed for mixed use.
- SEGREGATION: Follow local wiring rules for SELV/PELV versus mains circuits. Maintain separation in trays, conduits and junction boxes.
- ADDRESSING: After wiring, perform address scanning, group assignment and scene programming according to the control gear manufacturer's instructions.

Always apply the specific DALI system supplier documentation and national codes in parallel with this guidance.
